## **1.0 Introduction**

This permit applicant guide outlines the requirements for submitting a permit (see **Appendix 1**) to purchase and use a pesticide (i.e., larvicide to control mosquito larvae) for the prevention or control of West Nile Virus (WNV) on private land when supported by the local Medical Officer of Health (MOH). Private land includes but is not limited to:

- shopping centres
- schools and school boards
- apartment complexes, condominiums, townhouse complexes
- residential, farm, commercial and industrial properties
- recreational lands (e.g., conservation authorities, zoos, amusement parks etc.);
- Crown Land and associated properties
- utility company right of ways, rail lines or road ways
- other private land that is not included in a municipal or Health Unit WNV program.

Public notification requirements for WNV larvicide programs are included in this guide (see **Appendix 2**).

**NOTE: This guide does not include mosquito larvicide programs intended for nuisance control.**

Regulation 914 under the *Pesticides Act* requires:

- a person to obtain a permit approved by the Director under the Act, authorizing that person to apply a pesticide to a water body to control a pest (referred to as a water extermination).
- a licensed exterminator holding a Mosquito/Biting Flies or Aerial licence to obtain a permit approved by the Director under the Act, authorizing that exterminator to apply a pesticide to a water body.

Any person who owns land, is the occupant or is a full-time employee of the land owner or occupant is not required to obtain a permit to use a larvicide in a water body located on the land if the water body is wholly located within the boundaries of his or her land and has no direct or indirect outflow, other than by percolation, beyond his or her land boundary. This permit exemption does not include catch basins (since they drain off of the land to municipal storm drain systems) or road side ditches (unless the land owner is responsible for the ditch and it has no flowing water). Note: if the larvicide is a Schedule 2 product (see **Appendix 3**) the person, if not the holder of a Mosquito Biting Flies licence, will not be able to purchase the larvicide unless he or she obtains an approved permit.

Completed permit application forms and support documentation must be submitted to the Regional Pesticides Specialist (**See Table 1 for office locations**) responsible for the county in which the pesticide application will take place.

## **2.0 Mosquitoes as Vectors of West Nile Virus (WNV)**

The risk assessment made to determine whether or not WNV may impact people is based on numerous factors. Mosquito species identification and their numbers are part of this risk assessment and will determine the location and timing of larvicide applications, in order to disrupt the transmission cycle of WNV.

*Culex pipiens* and *Cx. restuans* are two mosquito species that feed predominately on birds but will occasionally bite humans and other mammals. *Culex* mosquitoes overwinter as adult females and possibly overwinter infected with WNV. It is also possible that migratory birds also return to Ontario infected with the virus. In early spring, the pre-mated *Culex* females that have survived the winter (mortality rate is high) disperse from overwintering sites in sewers, outbuildings, subterranean enclosures and basements to feed on the blood of birds (especially nestlings). *Culex* mosquitoes feed mainly after sunset and before dawn.

In Southern Ontario, *Cx. pipiens* and *Cx. restuans* are thought to be the species of importance in maintaining and amplifying WNV in the bird population. After feeding on the blood of birds, female *Culex* lay their eggs in containers, catch basins, grassy roadside ditches, tire ruts, rain barrels, swimming pool covers, stored boats or other containers that hold stagnant water. A favourable breeding site in early spring for *Culex* mosquitoes is inside cups, pop tins, plastic bottles, plastic bags, abandoned tires and other litter. *Cx. restuans* females emerge earlier than *C. pipiens* and the discarded containers that hold snow melt waters and spring rains provide an attractive incubated breeding site. Discarded litter should be collected and properly disposed of in early spring to reduce the number of potential breeding sites.

Several overlapping generations of *Cx. pipiens* or *Cx. restuans* may be present from April to August depending on temperature and breeding site abundance. The majority of adult *Culex* females that develop in mid to late August do not blood feed before mating and seeking overwintering sites (winter diapause). *Culex* females that develop from mid-summer broods may take numerous blood meals from WNV infected birds and when biting mammals infect the mammals with the virus.

WNV appears to be lethal to many birds in the family Corvidae (e.g., American crows, ravens and jays) and the presence of WNV-positive dead birds is often the first sign that WNV is present and spreading through the local bird population (known as enzootic amplification). *Cx. restuans* is likely the key enzootic species involved in the early season amplification of WNV in the bird population. Urban sparrow and starling populations may be potential reservoirs for WNV. Later in the season *Cx. pipiens* is the

predominant species breeding in stagnant water in catch basins, surface water and containers. WNV may spill over from the bird population to humans if *Cx. pipiens* feed on the blood of a WNV infected bird and then bites a human.

Controlling *Culex* mosquitoes in the early spring in surface waters to reduce the amplification of WNV in the bird/mosquito cycle and throughout the summer in catch basins to prevent the spill over of WNV to human populations should be considered as part of an integrated mosquito control program.

**The use of larvicides should be considered as part of an integrated mosquito management program that includes:**

- **public education and awareness campaigns that promote personal protection**
- **mosquito breeding site reduction on private and public land**
- **removal and proper disposal of discarded tires and other containers that hold stagnant water, and**
- **monitoring and surveillance programs**

**Larviciding programs targeting *Culex spp.* should be considered, based upon a local risk assessment, through early spring to mid summer in stagnant surface water bodies such as ditches and in early spring to late summer in catch basins to greatly reduce mosquito larvae development.**

Larviciding should be targeted to those catch basins that have high organic content due to a close proximity of trees or lawns which may contribute leaves and grass clippings. In general, catch basins located along major roadways and in parking lots do not have high organic content and therefore mosquito larvae are likely to be in low numbers.

Other species of mosquitoes that are predominant in summer months, such as *Aedes vexans*, *Coquilleltidia perturbans* and less common species such as *Culex salinarius*, *Ochlerotatus trivittatus*, *Och. triseriatus*, *Och. stimulans*, *Anopheles punctipennis* and *An. walkeri* may act as bridge vectors transmitting WNV from infected birds to humans. *A. vexans* breeds predominately in temporary pools created by rainfall (e.g., roadside ditches, flooded pastures) and adults are present from May to first hard frost. *C. perturbans* has one generation per year and breeds in cattail marshes. *Cx. tarsalis*, which is the primary enzootic species of WNV in western Canada, has been recently found in Northern Ontario and parts of Southern Ontario.

If adult mosquito trap surveillance indicates that bridge vectors have a high rate of virus infection then it may be necessary to initiate larviciding programs to target these specific species. Larviciding through late spring to early fall of temporary pools created by rainfall will control *A. vexans* larvae from developing into adult mosquitoes. This should lower the risk of humans developing WNV from summer biting mosquitoes. The control of *C. perturbans* in cattail marshes is very difficult. The larvae do not surface feed but

attach to hollow cattails to breathe and filter feed below the surface therefore the larvicide often does not contact the larvae.

### **3.0 Pesticide Regulations**

The management of pesticides is a joint responsibility of the federal and provincial governments. Health Canada's Pest Management Regulatory Agency (PMRA) is responsible for assessing pesticides to determine if they are acceptable in terms of safety, merit and value. Pesticides approved by PMRA are granted registration which allows them to be sold and used in Canada.

The Ministry of the Environment (MOE) regulates the sale, use, transportation, storage and disposal of federally registered pesticides in Ontario under the *Pesticides Act* and Regulation 914. Pest control products are classified into one of six classes or "schedules". The schedule determines who can sell or use the pesticide product and what restrictions (e.g., requires a licence and/or permit) are placed on its use. For current information on classified products, consult the Ontario Pesticides Advisory Committee web site and link to the PEPSIS data base at [www.opac.gov.on.ca](http://www.opac.gov.on.ca).

**Appendix 3** provides a list of currently classified larvicides for use under permit for WNV.

### **4.0 Private Land WNV Prevention and/or Control Programs**

Owners of private land (e.g., shopping centres, school boards, apartment complexes, residential, farm, commercial and industrial properties, utility company right of ways, rail lines etc.) or managers of recreational lands (e.g., conservation authorities, zoos, amusement parks etc.) or administrators of Crown Land (e.g., Management Board Secretariat, Ministry of Natural Resources, Ministry of Transportation, Ontario Realty Corporation, Hydro One, federal agencies etc.) may conduct a larviciding program in water bodies located on land they own or manage if authorized by the local MOH.

A mosquito control program would likely be initiated to support and compliment a municipal or Health Unit program that is authorized by a local MOH or is ordered under Section 13 of the *Health Protection and Promotion Act (HPPA)* in an urban area. A permit application that is authorized by a health hazard order, issued by the local MOH, will be considered as a very high priority by MOE.

**NOTE:** Catch basins located on private land normally drain into a public storm drain system and therefore written authorization must be obtained from the proper jurisdiction (e.g., town, city or municipality) and accompany any permit application in order to use a larvicide in a catch basin. Ditches in front of private land abutting public roads are considered easements and are the property of the town, city or municipality and written authorization to apply a larvicide into these surface water bodies must also accompany a permit application form. See **Section 4.4**.

A permit application form may be submitted by:

- a licensed exterminator contracted by a private land owner
- a private land owner who holds an appropriate exterminator's licence
- a full-time employee, who holds an appropriate exterminator's licence, of a private land owner.

The written authorization **or** a *HPPA* health hazard order from the local MOH must accompany the permit application form. Please note that this authorization may have the following conditions:

- ▶ Application of larvicide to water bodies on private land can occur only if the water body cannot be drained or modified (i.e., cost prohibitive or water body is a sensitive area).
- ▶ The licensed exterminator must provide in writing a copy of all permits. The information submitted must identify clearly the addresses of the private lands and the type of water bodies intended to be treated with a mosquito larvicide before the larviciding program begins.
- ▶ Copies of the year end reports (summary reports) submitted to the MOE, when completed, for all permits issued must be also submitted to the Health department.

**MOE encourages early submission (e.g., early April) of completed permit application forms and supporting documentation. Submissions will be reviewed and considered for approval subject to site-specific terms and conditions appended to the permit.**

**Applicants may “combine” treatment sites under a single permit. For example, if a licensed exterminator has contracted a school board within a Health Unit to apply larvicide to catch basins on 23 schools and larvicide to 5 ponds located at 5 schools then two permit applications must be submitted - Form 7A for all catch basins on the school board land and Form 7B to include the 5 ponds. For condominium complexes, several properties may be bundled under 1 permit application providing they are all located within the same Health Unit.**

#### **4.1 Surveillance**

Dead bird surveillance, adult mosquito trapping, larvae surveys and mapping are very important for determining the need for larviciding programs. Private land owners are encouraged to conduct surveillance and monitoring programs through a licensed exterminator and to coordinate their programs with the local municipality and/or Health Unit, who conduct dead bird, mosquito and human surveillance, to determine if a larviciding program is warranted.

## **4.2 Licensing Requirements and Technicians**

A pest management company requires an Operator's licence in order to run a business that uses pesticides to control pests. A pest management company that provides a service to control mosquito larvae is conducting a water extermination. This requires at least \$1 million in third-party liability insurance and other insurance requirements prescribed in Regulation 914. In addition, the company must ensure that its insurance policy allows for the use of pesticides in water (i.e., the policy has no exclusion for water exterminations). An Operator must hire appropriately licensed exterminators to carry out the larviciding program.

Private land owners that intend to use a larvicide in a water body located on their land are not required to obtain an Operator's licence if their full-time employees are appropriately licensed and apply the larvicide.

A WNV larviciding program must be conducted by an appropriately licensed exterminator holding one of the following valid licences:

- *Mosquito/Biting Flies* for ground equipment application of a larvicide
- *Aerial* for aircraft application of a larvicide

**An appropriately licensed exterminator may indirectly supervise (i.e., visit the extermination site at least once per week) up to 7 technicians. See Section 20.1, 20.2 and 20.3 of Regulation 914 under the *Pesticides Act* (on line versions are available at [www.e-laws.gov.on.ca](http://www.e-laws.gov.on.ca)) regarding the use of pesticides by unlicensed assistants.**

## **4.3 Permit Application Submission**

Private land owners may decide to submit a permit application in order to conduct larviciding programs based upon scientific/health related data such as real time dead bird and mosquito surveillance activities or past years surveillance data.

**MOE will only consider the use of larvicides containing methoprene or *Bacillus thuringiensis* var. *israelensis* under permit use for the control of WNV.**

Permit application forms and support documents for larviciding should be submitted separately for any of the following four types of larviciding programs:

### **A. Catch basins/storm drains:**

- Methoprene products will be considered for application to catch basins/storm drains since these are high in organic content and suspended silt and it is unlikely that non-target aquatic organisms will be present (Note: *Bti* has limited efficacy in water bodies with high organic and silt content).

- Label rate for methoprene pellets is 0.7 g per catch basin (equivalent to a broadcast application rate of 11.2 kg/ha in water with a high organic matter content) based on an average surface water area of 0.6 m<sup>2</sup>. Catch basins with an average surface water area greater than 0.6 m<sup>2</sup> would receive proportionately more of the methoprene pellets. Label rate for methoprene ingots is one ingot (briquet) per catch basin (Note: ingots are registered for use only in catch basins).
- A greater amount of methoprene pellets per catch basin is consistent with label directions if drainage from the catch basin is impeded and the water in the catch basin is backed up, above the level of the outlet pipe, allowing standing water in the storm sewer drain. This would be determined by a pre-treatment inspection (see **Appendix 8**). A review of best practices indicates that an amount of up to 3.5 g of methoprene pellets may be applied in such situations and is consistent with label directions.
- See **Appendix 8** for detailed information on determining application rates.

**B. Ditches and Temporary Pools or Permanent Pools including storm water management ponds**

- *Bacillus thuringiensis* var. *israelensis* (*Bti*) products will be considered for application in ditches and temporary pools or permanent pools including storm water management ponds since these water bodies may support non-target aquatic organisms (*Bti* is very specific to mosquito larvae and only has a minimal impact on other aquatic fly larvae).
- The rate of application will be determined by the larval instar stage, target species etc. as indicated on product labels.

**C. Sewage and sludge storage lagoons**

- Methoprene products will be considered for application in sewage and sludge lagoons since these water bodies are high in organic content and it is unlikely that non-target aquatic organisms will be present (Note: *Bti* has limited efficacy in water bodies with high organic content).
- A label rate for methoprene products of 11.2 kg/ha for broadcast application of pellets and 22.4 kg/ha of granules is in accordance with label directions for water with a high organic content (see **Appendix 6** for determining organic content of water bodies).

**D. Sensitive Areas:** Permit applications for Sensitive areas (see **Appendix 7**) will be reviewed according to the Sensitive Areas and Species Protocol developed cooperatively between the Ministry of Natural Resources and other environmental agencies (see **Appendix 10**).

- *Bacillus thuringiensis* var. *israelensis* (*Bti*) products will be considered for use in Sensitive areas since these water bodies often support non-target aquatic organisms (*Bti* is very specific to mosquito larvae and only has a minimal

- impact on other aquatic dipterans).
- The rate of application will be determined by the larval instar stage, target species, etc., as indicated on *Bti* product labels.

#### **4.4 Permit Submission Checklist**

##### **Previous Applicants:**

Applicants who:

- obtained an approved permit since 2003 for a mosquito larvae control program for WNV and provided MOE with hard copy maps/electronic maps and/or digital mapping coordinates; and
- are applying for a permit to conduct a mosquito control program for WNV without changes to the proposed treatment area information

must provide items 1, 2, 3, 4, 5, 7, 8 and 9 below.

You are not required to resubmit maps (item 6 below) with your permit application submission, however, maps will be required with your summary report.

##### **New Applicants:**

A new application for a permit to use a larvicide for the control of mosquito larvae as a preventative or control action against WNV **must** include the following information as support documentation:

1. ☐ A completed permit application form (see **Appendix 1**). Use permit application Form 7A when applying for approval to use a larvicide in **catch basins** and Form 7B when applying for approval to use a larvicide in **surface water bodies**.
2. ☐ Proof of insurance coverage indicating that your policy allows for a water extermination.
3. ☐ A copy of an order under the *Health Protection and Promotion Act* (see **Appendix 4 - Template 1** or a letter of authorization for larviciding on public and private lands from the local MOH (see **Appendix 4 - Template 2**) indicating:
  - A mosquito larviciding program is considered necessary or appropriate to reduce *Culex restuans* or *Cx. pipiens* larvae and prevent the enzootic amplification of WNV, based upon current data or data obtained from the previous year's WNV-positive dead bird and/or mosquito surveillance programs in that jurisdiction or a neighbouring jurisdiction **and/or**
  - A mosquito larviciding program is considered necessary to reduce *Cx. pipiens*, *Aedes vexans* or other mosquito species that may act as a bridge vector species for WNV from birds to humans based on data obtained from the current year's WNV-positive dead bird/animal/human and/or mosquito surveillance programs.

**NOTE:** A copy of a *HPPA* order or authorization letter from the MOH may be

already on file with the MOE. Contact the Pesticide Specialist to determine if this is the case (see **Table 1**).

4. ☐ A written statement from an official representative of a town, city, municipality, etc., within the jurisdiction where the private land is located, authorizing the use of a larvicide into catch basins, storm drains or ditches that are owned by the town, city, municipality etc. but are located on the private land. See **Appendix 4 - Template 3**. **NOTE:** This written statement is not required if an order is issued under the *Health Protection and Promotion Act*.
5. ☐ A written statement from the private land owner/manager authorizing the use of a larvicide. See **Appendix 4 - Template 4**.
6. ☐ Map(s) of the treatment site. Submission of electronic maps and/or digital mapping data are strongly encouraged. If available, please provide digital mapping data to the Regional Pesticides Specialist who will use your electronic information to generate maps for MOE purposes (depending on location within Ontario). Digital mapping coordinates and street addresses should be submitted as detailed in **Appendix 9**.

The minimum requirements for map elements for any type of larvicide program are as follows:

- map scale 1:25,000
- identification of all Sensitive areas (see **Appendix 7** for definitions) including;
  - ▶ critical fish habitat
  - ▶ wetlands
  - ▶ fish sanctuary
  - ▶ endangered and threatened species habitat

Mapping information for catch basins must include the:

- approximate boundaries of the treatment area(s) / storm sewer shed
- approximate number and approximate area of catch basins proposed for the treatment area / storm sewer shed (for schools, condominiums and other small private land sites exact locations must be provided)
- location of discharge points/outflows if catch basins are located at or near a Sensitive area (consult with the local municipality for this information - if not available, obtain a letter from the municipality stating that catch basin discharge points/outflows are not currently available and include this letter with the support documentation).
- name of the receiving water (e.g., Lake Ontario, Humber River) if catch basins are not located at or near a Sensitive area (**Please indicate catch basins which drain into a municipal sewer system**).

Mapping information for ditches, temporary and permanent pools, storm water retention ponds and Sensitive areas\* must include the:

- approximate boundaries of the treatment area(s)
- location of discharge points/outflows if the surface water treated is located at or near a Sensitive area (consult with the local municipality for this information - if not available, obtain a letter from the municipality stating that catch basin discharge points/outflows are not currently available and include this letter with the support documentation)
- name of the receiving water (e.g., Lake Ontario, Humber River) if the surface water treated is not located at or near a Sensitive area
- estimated total area (in hectares) proposed for treatment

\* Permit Applications for Sensitive areas must follow the protocol for a Sensitive Areas and Species (See **Appendix 10**)

For private land programs a second map detailing the site must be submitted with the permit application that includes the location of the land in relation to major intersections. This map may be a site blue print or drawing but must contain orientation (N, S, E, W), all buildings, parking areas and sensitive areas including:

- any creeks, streams, rivers, lakes that run through or border the land as well as any storm sewer out flows into these areas
- designation of bordering lands e.g. industrial factory, ravine, commercial business etc.

If digital mapping coordinates are submitted rather than maps, a statement regarding discharge and/or outflow must accompany the permit application Form 7A and/or 7B.

7. ☐ A description of measures that will be used to protect Sensitive areas from potential impact due to possible movement of the larvicide from the target area.
8. ☐ A description of the measures that will be used to identify which catch basins have been treated with a larvicide including the number of treatments per catch basin and which ones must not be treated with a larvicide.
9. ☐ Monitoring data is required for some types of larviciding programs. See Section **5.0** below for **required** pre and post larviciding monitoring data and Section **6.0** for **recommended** monitoring procedures.

#### **4.5 Summary Report Requirements**

MOE approved permit conditions will require that a summary report be submitted by December 1<sup>st</sup> identifying the location(s) where larviciding treatments occurred. See **Appendix 11** for summary report templates. **Note:** It is not necessary to use the exact

format provided in these summary report templates, however, all of the information indicated in these templates must be provided. The MOE strongly encourages that all information submitted on the actual locations and/or areas of larvicide use be submitted in electronic format including digital mapping coordinates (see **Appendix 9**).

**Larvae Monitoring Forms:** Completed pre and post larviciding monitoring forms (see **Appendix 5**) for Sensitive areas and pre larviciding monitoring forms for ditches and temporary or permanent pools (including storm water management ponds) must be retained by the permit holder for a period of two years and be readily available upon request by the MOE. See section **5.0** below for MOE requirements. See **Appendix 11** for the summary information that must be provided on pre and post larviciding monitoring.

### **5.0 MOE Permit Requirements for Monitoring**

A textual description of the methods that will be used to comply with the MOE requirements listed below **must be included** with the permit application support documentation.

**A. Catch basins/storm drains using methoprene:**

- No monitoring requirements - See section **6.0** below for monitoring recommendations.

**B. Ditches and Temporary or Permanent pools (including storm water management ponds) using *Bti*:**

- MOE **requires** that pre-larviciding monitoring be conducted to determine organic matter content (e.g., presence of algae on water surface indicates high organic content and requires a higher label rate) and larval instar stage (e.g., lower label rate for 1<sup>st</sup> and 2<sup>nd</sup> instars; higher label rate for 3<sup>rd</sup> and 4<sup>th</sup> instars) in order to select the proper application rate of *Bti* (see **Appendix 5**). **Note:** larvae must be present in order to apply *Bti*.

**C. Sewage or Sludge lagoons using methoprene:**

- No efficacy monitoring requirements (see section **6.0** below for efficacy monitoring recommendations).

**D. Sensitive areas using *Bti*:**

- MOE **requires** that pre-larviciding monitoring be conducted to determine degree of organic material content and larval instar stage in order to select the proper application label rate of *Bti*.
- MOE **requires** that post-larviciding monitoring of 10 typical sites (minimum) be conducted to sample for the number of larvae present within 24 - 48 hours after treatment of *Bti* to determine efficacy (see **Appendix 5**).

## **6.0 MOE Recommendations for Monitoring**

MOE recommendations listed below are at the discretion of the permit holder.

### **A. Catch basins/storm drains using methoprene:**

- MOE **recommends** the pre-larviciding monitoring of catch basins to determine larvae counts and evaluate a need to apply methoprene.
- MOE **recommends** the post-larviciding monitoring of catch basins to determine pupal development to adult (refer to the methoprene product guide literature or the guidance for methoprene efficacy monitoring provided in **Appendix 6**).
- MOE **recommends** pellets and ingots be placed only in catch basin sumps that contain water. Recent studies indicate that lower water levels in a catch basin sump caused by leaf and/or silt debris provides for less water to be retained in the sump increasing the chance of pellets or ingots being flushed out during a heavy rain event.

MOE suggests that a minimum of 30 catch basins proposed for larvicide treatment with a larvicide be randomly selected and monitored for methoprene efficacy.

### **B. Ditches and Temporary or Permanent pools (including storm water management ponds) using *Bti*:**

- MOE **recommends** that post-larviciding monitoring of ditches and temporary or permanent pool to sample for the number of larvae present within 24 - 48 hours after treatment of *Bti* to determine efficacy

MOE suggests that post-larviciding monitoring should include as a minimum, several ditches, temporary pools and permanent pools and sampling around the margins at several points of these water bodies.

### **C. Sewage or Sludge lagoons using methoprene:**

- MOE **recommends** that pre-larviciding monitoring at 10 points around the perimeter of sewage or sludge lagoons to determine larva counts and evaluate a need to apply methoprene.
- MOE **recommends** post-larviciding monitoring at 10 points around the perimeter of sewage or sludge lagoons to determine pupal development to adult (refer to the methoprene product guide literature or the guidance for methoprene efficacy monitoring provided in **Appendix 6**).

### **D. Sensitive areas using *Bti*:**

See requirements in section **5.0** above.

## **7.0 Permit Conditions**

Permit applications will be reviewed by the Regional Pesticide Specialists. A permit application that is complete and includes all of the required support documentation will be processed within five business days of receipt.

**A licensed exterminator who is granted an approved permit to apply a larvicide must comply with the requirements of Regulation 914 under the *Pesticides Act*. In addition, the approved permit may have the following conditions:**

- Larvicide use is limited to a licenced exterminator (Mosquito/Biting Flies for ground-based application or Aerial for aircraft application), or a trained Technician under the supervision of a Mosquito/Biting Flies licence holder (in accordance with Sections 20.1 and 20.2 of Regulation 914 under the *Pesticides Act*) or a licensed exterminator who is considered a Technician in accordance with Section 20.1 (1.1) of Regulation 914 under the *Pesticides Act*.
- This permit and conditions of use are approved for 200\_ only.
- A copy of the permit must be provided to each larviciding crew at an extermination site.
- Larvicide must be applied according to label directions.
- Larvicide (pellets or ingot formulations) must be placed into catch basins through the grate. Larvicide must not be applied into catch basins if there is significant water flow, such as during heavy rainfall, that does not allow for the proper settling of the larvicide at the bottom of each catch basin sump.
- Public notification must be provided as set out in the document “Public Notification of a Water Extermination for the Control of Immature Stages of Mosquitoes (Larviciding Programs for WNV)” (see **Appendix 2**).
- The licensed exterminator responsible for the use of the larvicide must immediately report any situations involving health or environmental effects or damage to property resulting from the application of the larvicide to the local MOE District Office (telephone number will be provided on the approved permit), or if a pesticide spill occurs, to the Spills Action Centre at **1-800-268-6060**.
- A summary report (see **Appendix 11** for templates) must be provided by December 1<sup>st</sup> of the year to the Regional Pesticides Specialist.
- Additional conditions determined on a case by case basis.

## Appendix 2

### Public Notification of a Water Extermination for the Control of Immature Stages of Mosquitoes (Larviciding Programs for West Nile Virus) Private Land Programs

Public notification Option 1 or 2 or 3 must be used for larvicide applied on private land to:

- A. Catch Basins
- B. Ditches, temporary or permanent pools including storm water management ponds
- C. Sewage or sludge lagoons
- D. Sensitive Areas

#### Option 1

Publication of a notice in a newspaper of general circulation in the vicinity of the proposed water extermination at the beginning of the larviciding program and printed such that it is not less than 10 cm in width or the nearest equivalent in column layout. (For example, a notice would be published in a local newspaper in April indicating that larvicide will be placed in catch basins on the private land every three weeks until September X). See sample notice below.

#### Option 2

Distribution of a written notice at the beginning of the larviciding program to all land owners or persons in charge of land within the application area. In addition, the posting of the notice at all door entrances to public buildings on the private land prior to each larviciding treatment and to remain posted for at least 48 hours. (For example - catch basin larviciding at several schools; a notice would be provided to the superintendent of the school board and to the principal of each school in April. In addition, the notice must be posted before each larviciding treatment and remaining posted for at least 48 hours on all entrance doors to the school where the larvicide is being applied). See sample notice below that can also be modified for surface water larviciding.

The notice in Option 1 and 2 above must include the following:

- The details of the larviciding program including:
  - ▶ the pest to be controlled (i.e., mosquito larvae) and purpose for control (i.e., West Nile Virus).
  - ▶ proposed date(s) the water extermination is to take place.
  - ▶ the location of the larviciding program (e.g., name of the water body, street boundaries, all catch basins on a specific street, etc.).
  - ▶ the name of the larvicide and the registration number assigned to the product under the *Pest Control Products Act* (Canada).
  - ▶ the formulation (e.g., pellet, granular, ingot, liquid).
  - ▶ a telephone number (indicating collect calls will be accepted) that provides the public with information regarding the larviciding program and includes updates on the street location and dates of larviciding. A web site may be used in addition to a telephone number.

## Sample Notice for Catch Basins:

### NOTICE OF PESTICIDE USE

Between April 1 to October 31, 200 the [name of private land] will be conducting a larviciding program under the authority of the Local Medical Officer of Health to control larval mosquitoes in order to prevent their development into vectors of West Nile Virus. The pellet formulation of the larvicide methoprene [provide Product Name and registration number under the Pest Control Products Act (Canada)] will be placed into catch basins of storm drains in the following area [provide street address(es)]. All larvicide will be applied by applicators, licensed by the Ministry of the Environment, or supervised technicians. For details on the exact locations and dates of treatment please call [1-800----- if not a toll-free number indicate collect calls will be accepted] or at the following web site: www.-----.

### Option 3

The conspicuous posting of a public area sign (rectangular and at least 51 cm high and 38 cm wide) every 100 metres along the perimeter of the surface water body OR at all entrances to the private land immediately before the application of the larvicide and remaining for at least 48 hours. The public area sign must include the following on the front of the sign:

- ▶ red lettering with the words “WARNING” and “PESTICIDE USE”
- ▶ a red circle and red bar over a single black silhouette of an adult person
- ▶ black lettering with the words “FOR INFORMATION CONTACT” and “CALL COLLECT” and a telephone number provided in 1.5 cm high numerals (indicating collect calls will be accepted) that provides the public with information regarding the larviciding program and includes updates on the street location and dates of larviciding
- ▶ black lettering with the words “DATE POSTED” and “DATE SPRAYED” or “DATE APPLIED” (these dates will be the same since the sign must be posted immediately before larviciding - lettering and numerals must be 1.5 cm high)

The public area sign must include the following on the back of the sign:

- ▶ black lettering with the words “PESTICIDE” and 1.5 cm high lettering to indicate the name of the pesticide used (e.g., Methoprene or *Bacillus thuringiensis israelensis* or the product name)
- ▶ black lettering with the words “REGISTRATION NUMBER” and 1.5 cm high numerals to indicate the *Pest Control Products Act* Number of the product
- ▶ black lettering with the words “TO CONTROL” and 1.5 cm high lettering to indicate the pest (e.g., Mosquito Larvae)
- ▶ A web site may be provided in the bottom 5 cm of the sign

# WARNING

# PESTICIDE USE

## FOR INFORMATION

CONTACT.....

CALL COLLECT.....

DATE POSTED.....

DATE SPRAYED or.....

### Public Area Sign

Sign to be 51cm x 38cm (minimum) rain resistant, sturdy to be reused

→Capital **Red** letters 5cm (minimum)

→Black single silhouette of an adult person on white background. **Red** circle (outer edge a minimum of 21.5cm in diameter and width one tenth of the diameter) and oblique **red** bar

→Capital **Red** letters 5cm (minimum)

→Capital Black letters 1.5cm (minimum) and telephone number of representative or person performing the land extermination; numbers to be 1.5cm in height (minimum)

→Capital Black letters 1.5cm (minimum) and long distance telephone number, if applicable; numbers to be 1.5cm in height (minimum)

→Capital Black letters 1.5cm (minimum) and, day/month/year of posting, and/or preposting (if applicable) and day/month/year of pesticide application; numbers to be 1.5cm in height (minimum)

→Words or markings that identify the employer of the person performing the land extermination or that identify the owner/occupier or person in charge and that do not detract from the sign; not to occupy more than bottom 5cm of the sign

**PESTICIDE.....**

→Capital Black letters 1.5cm (minimum) and pesticide name; letters to be 1.5cm in height (minimum)

**REGISTRATION  
NUMBER.....**

→Capital Black letters 1.5cm (minimum) and *Pest Control Products Act No. (PCP No.)* or *Fertilizers Act No. (FA No.)*; numbers to be 1.5cm in height (minimum)

**TO CONTROL.....**

→Capital Black letters 1.5cm (minimum) and name of pest; letters to be 1.5cm in height (minimum)

→Words or markings that identify the employer of the person performing the land extermination or that identify the owner/ occupier or person in charge and do not detract from the sign, or additional words or markings that have been approved in writing by the Director under the Act; not to occupy more than bottom 5cm of the sign

Consult with the PMRA at 1-800-267-6315 to ensure current registration status.

\* A pesticide may only be applied by aircraft if the label directions specify this method of application.

\*\* A permit is not required if a pesticide is applied by the land owner/occupant or their full-time employee in a wholly contained water body with no direct or indirect outflow from the land.

**Appendix 4  
-Templates -**

1. Local Medical Officer of Health (MOH) Order under S. 13 of the *HPPA*
2. MOH Authorization Letter for Larviciding on Municipal/Private Lands
3. Jurisdictional Authorization from the town, city or municipality who own the storm drain systems or waterways allowing a private land owner/occupant to contract a licensed exterminator to place larvicide into water bodies located on the private lands that drain into town, city or municipality owned storm drain systems or waterways.
4. Private land owner/occupant authorization to apply larvicides in a water body on the private land by a licensed exterminator.

Note: the following templates may contain statements that do not apply to all jurisdictions.

**Template 1. Local Medical Officer of Health (MOH) Order under S. 13 of the *HPPA***  
**Order**

Made Pursuant to Section 13 of the *Health Protection and Promotion Act*, R.S.O. 1990, c. H.7

Date:

To:

WHEREAS pursuant to the *Health Protection and Promotion Act*, R.S.O. 1990, c. H.7, as amended (the "Act"):

1. a "health hazard" includes any thing or "animal other than man" that has or that is likely to have an adverse effect on the health of any person;
2. the Medical Officer of Health may, by order, require any person to take, or refrain from taking any specified action with respect to a health hazard. Such an order may include a requirement to do specified work, on or about premises specified in the order, and may include a requirement to destroy things specified in the order,
3. the Medical Officer of Health, or a person acting under his/her direction, is authorized to enter and have access to, through and over any premises in order to carry out a direction given under the Act. The authority to enter premises, however, is not authority to enter a private residence without the consent of the occupier;
4. no person shall hinder or obstruct a person acting under the direction of a Medical Officer of Health lawfully carry out a power, duty or direction under this Act;
5. any person who fails to obey an order made under this Act is guilty of an offence and is liable on conviction to a fine as outlined below; and
6. every board of health is required to ensure the provision of health programs and services including the prevention or elimination of health hazards and the control of infectious and reportable diseases.

AND WHEREAS pursuant to section 474.21 of the *Municipal Act*, 2001, S.O. 2001, c. 25, the [name of regional municipality] has all the powers, rights and duties of a board of health under the *Health Protection and Promotion Act* 2002, c. 17, Sched. A, s. 91.; [NOTE: this statement applies only to regional municipalities and does not include The District Municipality of Muskoka].

I, [name of Medical Officer of Health of the name of jurisdiction] order you to assist in, and facilitate the implementation of, such treatment methods as directed by me, in the [name of jurisdiction under the order], to control and reduce the number of mosquito larvae including, but not limited to assisting in and facilitating the:

1. application of larvicides to known or suspected mosquito breeding sites including but not limited to areas of standing water in catch basins, storm water management ponds, ditches, ponds and other bodies of water; and
2. employment of measures to eliminate standing water on public and private land;

**THE REASONS FOR THIS ORDER ARE THAT:**

1. in 200\_, the Medical Officer of Health received laboratory confirmation that certain persons in [name of MOH's jurisdiction] became infected with the West Nile Virus;
2. in 200\_, the Medical Officer of Health received laboratory confirmation that certain mosquitoes in the [name of MOH's jurisdiction] were infected with the West Nile Virus;
3. West Nile Virus is transmitted to humans by mosquitoes. Mosquitoes are known to breed in areas of standing water within [name of MOH's jurisdiction] including catch basins, storm water management ponds, ditches, ponds and other bodies of water;
4. West Nile Virus can adversely affect human health and, in some cases, can cause death;
5. it is reasonable to expect that mosquitoes infected with West Nile Virus are now breeding and the risk of human infection will increase as the weather becomes warmer;
6. to protect human health, I believe it necessary to institute a mosquito control program which includes the application of larvicides to areas of standing water which may contain mosquito larvae and populations;
7. to be effective, larviciding must take place in the spring and summer in an attempt to reduce the number of infected mosquitoes and the consequent threat to human health; and
8. I am advised by [name of MOH's jurisdiction] Public Health representatives that the [name of MOH's jurisdiction] has retained a licensed applicator of larvicides to apply mosquito control treatment methods on public and private land which application program can start forthwith.

Therefore, I am of the opinion on reasonable and probable grounds that:

1. a health hazard exists in the health unit served by me; and
2. the requirements specified in this order are necessary to decrease or eliminate the health hazard.

## NOTICE

TAKE NOTICE THAT you are entitled to a hearing by the Health Services Appeal and Review Board if you deliver to me and to the Health Services Appeal and Review Board, Health Boards Secretariat, 151 Bloor Street West, 9<sup>th</sup> Floor, Toronto, Ontario. M5S 2T5, notice in writing, requesting a hearing within fifteen (15) days after service of this Order.

AND FURTHER TAKE NOTICE THAT although a hearing may be requested, this Order takes effect when it is served to you.

FAILURE to comply with this Order is an offence for which you may be liable, on conviction, to a fine of not more than \$5,000.00 (for a person) or \$25,000.00 (for a corporation) for every day or part of each day on which the offence occurs or continues.

[Signature of MOH]

### Template 2. MOH Authorization Letter for Larviciding on Municipal/Private Land

To: Regional Pesticide Specialist [see Table 1 for address]

Dear:

RE: West Nile Virus - Application of Larvicides on [Municipal/Private] Lands

This letter is to confirm that I authorize the application of larvicides to mosquito breeding sites on [municipal/private] lands with the [name of MOH's jurisdiction], especially as it relates to standing waters and catch basins. I also authorize the application of larvicides to other areas within the [name of MOH's jurisdiction], under the jurisdiction of other governmental authorities, found to contain mosquito species known to transmit West Nile virus.

My decision to authorize this action is based on the Health Department's 200\_ WNV surveillance and monitoring program which identified human cases as well as extensive enzootic spread. These findings represent a significant health risk to the residents of [name of MOH's jurisdiction].

This support has the following conditions:

- Application of larvicide to water bodies on private land only if the water body cannot be drained or modified.
- The licensed exterminator must provide a copy of all approved permits to the MOH. The information submitted must identify clearly the addresses of the private lands and the type of water bodies intended to be treated with a mosquito larvicide before the larviciding program begins.
- Copies of the year end reports (summary reports) submitted to the Ministry of the Environment, when completed, for all permits issued must be also submitted to the Health department.

I am also enclosing copies of letters from [town, city or municipalities] in the [name of MOH's jurisdiction].

[Signature of the Medical Officer of Health (MOH)]

### Template 3. Jurisdictional Authorization

To: Local MOH

Dear MOH:

The [name of town, city or municipality etc. within the MOH's jurisdiction] supports local action by [name of MOH's jurisdiction] to reduce the risk of West Nile virus. As a result, [name of town, city or municipality etc. within the MOH's jurisdiction] authorizes any permit application for West Nile virus control submitted to the Ministry of the Environment from an appropriately licensed exterminator, to apply a larvicide into catch basins or surface water located on private lands within and [owned/ managed] by [name of town, city or municipality within the MOH's jurisdiction].

[Signed by an official representative of the town, city, municipality etc.]

### Template 4. Private Land Owner/Occupant Authorization

To: Local MOH

Dear MOH:

I [name of private land owner or occupant] authorize [name of licensed exterminator and pest management company] to apply a larvicide into water bodies located on my land in order to reduce the risk of West Nile virus.

[Signed by the private land owner or occupant]

## POST-LARVICIDING MONITORING FOR METHOPRENE EFFICACY

1. Determine the catch basins that will be used in the monitoring study. Take samples of pupae from these same catch basins every week. Note the date when the larvicide was applied, the organic content, any oil sheen on water surface and temperature of the water. Do not take samples after a major rain event since pupae will likely to have been flushed out of the catch basin.
2. Collect 3 separate samples of pupae\* only once a week from each of the randomly selected treated catch basins and from nearby untreated catch basins (if available). Record number of pupae.
3. Place the pupae in a covered foam coffee cup or soup container (half-filled with water from the catch basin) and cover with netting or screening. Transport in a cooler with ice packs. Place the container in a sheltered area where the pupae will not be disturbed. Keep at a constant temperature, without direct light (i.e., they can be kept in a room in which the light is on during the day and turned off at night).
4. Check for emergence every day for up to four days and identify the emerged species.
5. Count the number of dead pupae (DP), dead adults (DA) and alive adults (AA).
6. Use the following formula to determine the % control =  $(DP+DA) \div (DP+DA+AA) \times 100$
7. Record results in an Excel spreadsheet format to facilitate calculations (see example below)

Most catch basins should have less than 10% emergence up to 21 days using methoprene pellets. Some catch basins may show less control (perhaps due to flushing, larger than normal size catch basin or storm drain, or some other reason) and should be retreated.

\* Pupae may be difficult to capture, if so, capture late 4<sup>th</sup> instar larvae and allow to pupate. These should remain separate from any captured pupae. Do not capture earlier instars as these will not provide a measure of efficacy.

### Recording Results:

Treated Site	No. of Pupae	DP	DA	AA	% Control	Control Site	No. of Pupae	DP	DA	AA	% Control
Sample 1						Sample 1					
Sample 2						Sample 2					
Sample 3						Sample 3					
Sample 4						Sample 4					
Sample 5						Sample 5					
Sample 6						Sample 6					
Sample 7						Sample 7					
Sample 8						Sample 8					
Sample 9						Sample 9					
Sample 10						Sample 10					

## Appendix 7

### Sensitive Areas Definitions

#### **SENSITIVE AREAS- DEFINITIONS**

**CRITICAL FISH HABITAT:** Those habitat areas which are needed to maintain the overall productive capacity of the fishery. These can include spawning areas for fish species with stringent spawning requirements, such as cobble areas for walleye and Lake trout, ground water upwelling areas for Brook trout; highly productive nursery and feeding areas such as wetlands; areas with Species at Risk; essential refuge areas such as winter refugium for Brook trout in small streams; habitat that are not replaceable or compensatable such as ground water upwellings, and migration routes which provide access to spawning areas for fish species with stringent spawning requirements (e.g., Brook trout). These include habitat types that are relatively rare or sensitive to disturbance. Alterations in these areas will result in a loss of productive capacity of fish habitat. Critical habitat require a high level of protection because of their importance in sustaining subsistence, commercial or recreational fisheries, their rareness, their high productive capacity, the sensitivity of certain life states for the fish species they support etc.

**WETLANDS:** Are lands that are seasonally or permanently covered by shallow water as well as lands where the water table is close to, or at the surface; in either case, the presence of abundant water has caused the formation of hydric soils and has favoured the dominance of either hydrophytic or water tolerant plants. The general term wetlands, includes specific land types that are known as swamps, marshes, bogs and fens.

- Swamps are wooded wetlands with 25% cover or more of trees or tall shrubs. In swamps, standing to gently flowing waters occur seasonally or persist for long periods on the surface. Swamps include both forest and thicket swamps.
- Marshes are areas periodically inundated with standing or slowly moving water, and/or permanently inundated characterized by robust emergents, and to a lesser extent, anchored floating plants and submergents.
- Bogs are peat-covered areas or peat-filled depressions with a high water table and a surface carpet of mosses, chiefly *Sphagnum* spp.
- Fens are peatlands characterized by surface layers of poorly to moderately decomposed peat, often with well decomposed peat near the base. They are covered by a dominant component of sedges, although grasses and reeds may be associated in local pools.

Periodically soaked or wet lands being used for agricultural purposes which no longer exhibit wetland characteristics are not considered to be wetlands for the purposes of this definition.

**FISH SANCTUARY:** Is a water body (or a portion of a water body) in which fishing for all species is prohibited for a specified period of time and is identified in the annual Ontario Sport Fishing Regulations, published by the Ministry of Natural Resources at <http://www.mnr.gov.on.ca/MNR/fishing/gen.html>.

**ENDANGERED AND THREATENED SPECIES HABITAT:** See section 6 of the Provincial Policy Statement at [http://www.mah.gov.on.ca/userfiles/HTML/nts\\_1\\_23137\\_1.html](http://www.mah.gov.on.ca/userfiles/HTML/nts_1_23137_1.html) for a definition of “significant” in regard to endangered and threatened species and for definitions of endangered species and threatened species.

## Appendix 8

### Assessing Catch Basins to Determine Application Rate of Methoprene Pellets

Most modern catch basins are cylindrical, have 900 mm diameter (0.9 m diameter or 0.45 m radius), are 2.3-2.4 m deep in total (including ring spacers and cover), have a water depth below the outlet pipe of 600 mm (when there is no flow), and a water surface area of 0.636 m<sup>2</sup>. However, older catch basins may be of different sizes, shapes, and have different surface areas. Thus, it is important that mosquito control workers consult local public works officials on the dimensions of the catch basins in any particular area of the jurisdiction. Catch basins in newer suburban areas may differ in size from those in older downtown areas and along highways within a municipality or Health Unit.

Public Work officials may be able to provide computer-based maps and a numbering system for the catch basins within their jurisdiction. Some databases may also include information on the size of individual catch basins.

Drainage from some catch basins may be partially blocked, increasing the total water volume associated with that catch basin and others 'upstream' from it. Local water engineers may be able to advise on what percentage of the catch basins fall into this category and where they are most likely to be located.

Calculations showing how much methoprene pellets to apply to a standard modern catch basin have been provided (see below). It may be necessary to inspect a representative sample of catch basins (e.g., 1%) and base the application rate on the average surface area of the catch basins in an area.

#### Sample Calculations

**Assumption:** the catch basin has a 0.45 m radius.

**Formula Used:** Area (circle) =  $\pi r^2$  (pi x radius squared) where  $\pi = 3.14159$

**Area of Standard Catch Basin:**  $3.14159 \times 0.45 \text{ m} \times 0.45 \text{ m} = \underline{0.636 \text{ m}^2}$

**Application Rates based on methoprene pellets:** Label rate states - 5.6 -11.2 kg/ha or 0.56 -1.12 g/m<sup>2</sup> of water surface, then

Low application rate =  $0.636 \text{ m}^2 \times 0.56 \text{ g/m}^2 = \underline{0.356 \text{ g}}$

High application rate =  $0.636 \text{ m}^2 \times 1.12 \text{ g/m}^2 = \underline{0.712 \text{ g}}$

The water in a catch basin can be considered to be polluted and/or highly organic therefore the high application rate is recommended on the label.

#### **Amount to Use per Catch Basin:**

How much methoprene pellets is 0.712 g?

From the Material Safety Data Sheet (MSDS), we find Specific Gravity = 1.04 g/cc

Thus,  $1.04 \text{ g/1 cc} = 0.712 \text{ g/'x' cc}$ ; therefore, 'x' = 0.69 cc

Because 1 teaspoon = 5 cc then 0.69 cc = ~ 0.14 teaspoons use slightly under a quarter teaspoon/ standard catch basin

#### **Measuring Spoons:**

Long-handled measuring spoons are available as part of a set from most food and department stores. Due to the irregular shape of the pellets, a level 0.25 teaspoon of methoprene pellets would be a practical treatment per one standard catch basin.

## Appendix 9

### Submitting Geo-spatial Information for Private Land Mosquito Control Programs

The use of Geographic Information System (GIS) databases will provide a more efficient way of analysing the surveillance, monitoring and larviciding data collected to manage West Nile virus. The Ministry of the Environment is encouraging that all mapping data be submitted in electronic format including digital mapping coordinates derived from Global Positioning Systems (GPS). Digital map coordinates for all catch basins, ditches, temporary and permanent pools and storm water retention ponds areas could be submitted with either the permit application and/or final report. MOE will use the information to generate provincial maps for Ministry purposes in evaluating permit applications.

To ensure that there is consistency across the province, all geo-spatial data including both map coordinates and tabular information need to be submitted in electronic format conforming to the data standards summarized below.

The standards which follow apply to all data submitted including format requirements for digital mapping coordinates and address standards:

- Electronic map files must be ESRI software technology compatible (i.e., Arc/Info coverages or ArcGIS shape files) referenced to North American Datum 83 (NAD83) projected using the Universal Transverse Mercator (UTM) projection system. UTM zone and accuracy estimates must be provided (see example below)
- All map coordinates should be submitted in a spreadsheet or database (Excel or MS Access)
- When data is submitted electronically in a spread sheet or database format, columns should use clearly identified titles and provide a detailed description of codes used
- Standard street addresses must include street number, proper spelling of the street name, standard abbreviations (see below), direction (N, S, E, W) and municipality addresses should not include any punctuation

Map Data Example:

ID	Zone	Easting	Northing	Accuracy
1	17	611630.56	4861180.03	±10m
2	17	622507.43	4865770.27	±10m

Address Example:

ID	Address	Municipality
1	1180 Lakeshore RD W	Toronto
2	252 Bloor ST E	Toronto
3	2075 Bayview AVE	Toronto

Some of the most common abbreviations include, but are not limited to the following:

Avenue	AVE	Gardens	GDNS	Square	SQ
Bay	BAY	Gate	GATE	Sideroad	SR
Beach	BEACH	Heights	HTS	Street	ST
Boulevard	BLVD	Highway	HWY	Terrace	TERR
Centre	CTR	Lane	LANE	Trail	TRAIL
Circle	CIR	Line	LINE	View	VIEW
Concession	CONC	Meadow	MEADOW	Way	WAY
Corners	CRNRS	Park	PK		
Court	CRT	Parkway	PKY		
Crescent	CRES	Path	PATH		
Cul-de-sac	CDS	Place	PL		
Drive	DR	Point	PT		
Expressway	EXPY	Road	RD		

**Appendix 10**  
**Sensitive Areas and Species Protocol**  
**Ontario Ministry of Natural Resources Process for Providing Input to MOE Concerning West Nile Virus**  
**Larvicide Treatments in Sensitive Areas**

## **INTRODUCTION**

Public health units may order the use of larvicides in Sensitive areas, to control mosquito populations and the spread of West Nile Virus (WNV). Decisions to implement WNV control measures are based on local risk assessments, which include consideration of the results of mosquito larvae surveillance and proximity of areas of standing water to inhabited areas.

The Ontario Ministry of the Environment (MOE) is responsible for regulating and licensing the use of pesticides, including the larvicides used to control mosquito populations. The bacterial larvicide *Bacillus thuringiensis israelensis* (Bti) is the only mosquito treatment permitted in Sensitive areas. It targets the larvae of mosquitoes and other dipterans.

An inter-agency review committee has been established, in response to the potential negative impacts of such treatments on rare and sensitive species that may be present in these habitats. The committee consists of representatives from the Ontario Ministry of Natural Resources (MNR), MOE, and two federal agencies: Environment Canada (E.C.), and Fisheries and Oceans Canada (DFO).

Legislative and Policy Framework: (Note: all Provincial Statutes and Regulations are available on line at <http://www.e-laws.gov.on.ca> and all Federal Statutes and Regulations are available on line at <http://laws.justice.gc.ca/en/index.html>.)

- *Endangered Species Act*: WNV larvicide treatments must take account potential impacts on species regulated under this provincial legislation.
- *Species at Risk Act*: The prohibitions and enforcement components of this federal legislation have been delayed for approximately one year, until June 2004. However, sections that relate to the assessment of species by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) are now in force, as are other sections that address requirements for the preparation of recovery strategies, action plans or management plans for species listed in Schedule 1 of the Act (as applicable) and requirements to conduct environmental assessments.
- Accord for the Protection of Species at Risk in Canada: As a signatory to this (1996) agreement, Ontario has made a commitment to participate in a national program that seeks to achieve the protection and recovery of species at risk, and the monitoring of all wild species. Under the Accord, signatories agree, among other things, to “provide protection for the habitat of threatened or endangered species” and to “emphasize preventative measures to keep species from becoming at risk.”  
(On line at [http://www.speciesatrisk.gc.ca/recovery/accord\\_e.cfm](http://www.speciesatrisk.gc.ca/recovery/accord_e.cfm))

The committee provides a forum for discussion of potential impacts of WNV larvicide treatments on species at risk (SAR). The objective of the committee is to provide the MOE recommendations - which areas are to be treated, and how - that will minimize impacts on SAR.

- *Fisheries Act:*

*Section 36:* The use of larvicides or other pesticides in areas considered to be waters frequented by fish, or fish habitat or in places where they are likely to enter waters frequented by fish or fish habitat can be considered as deposit of deleterious substances under Subsection 36(3) of the *Fisheries Act*. Section 36 would apply to wetlands designated to be fish habitat.

The Compliance and Enforcement Policy for the Habitat Protection and Pollution Prevention Provisions of the *Fisheries Act* states that compliance with the federal *Fisheries Act* is mandatory. Subsection 36(3) of the *Fisheries Act* specifies that unless authorized by federal regulation, no person shall deposit or permit the deposit of deleterious substances of any type in water frequented by fish, or in any place under any conditions where the deleterious substance, or any other deleterious substance that results from the deposit of the deleterious substance, may enter any such water. Proponents should note that only a federal regulation under the *Fisheries Act* or another Act of Parliament can authorize a discharge of a deleterious substance; no federal permit, provincial, territorial or municipal regulatory permit or approval allows for exemption from the *Fisheries Act*.

For pesticide applications, alternatives to use in areas of waters frequented by fish or fish habitat should be fully investigated. For situations where there is the likelihood of entry of these pesticides into areas of fish habitat, each situation should be assessed on a case by case basis to determine if there is the potential for deleterious impacts on the aquatic community. Environment Canada will assess each situation brought to its attention to determine whether or not there are reasonable grounds to believe that there is the potential for violation of section 36(3) of the *Fisheries Act*."

*Section 35:* Subsection 35(1) prohibits works or undertakings that result in the harmful alteration, disruption or destruction of fish habitat (HADD), unless authorized by the federal Minister under section 35 (2).

NOTE: section 35 is pertinent to any proposal that would physically impact fish habitat ( i.e., filling in wetlands or creeks, etc.), as opposed to larvicide applications, which are subject to section 36.

Implementation of section 35 is a cooperative effort involving a number of federal and provincial agencies, including the Department of Fisheries and Oceans, Environment Canada, conservation authorities, MNR and MOE. DFO is responsible for protecting habitats that contribute directly or indirectly to Canada's fisheries resources. If a HADD of Canadian fisheries waters (a creek, lake or littoral wetlands) is proposed, DFO should be consulted either directly or through the local conservation authority. DFO-conservation authority agreements assist in providing a streamlined approach to regulatory approvals.

Note that the determination of whether or not a given area would be considered as Canadian fisheries waters is not always straightforward. Back yard ponds and roadside ditches typically are not considered to be such, and therefore are of less concern.

If additional information is required, Medical Officers of Health and other provincial and local officials are encouraged to contact regional officials of DFO and EC. The Pest Management Regulatory Agency (PMRA) is the lead federal agency regulating the use of pesticides, and should also be involved in discussions.

- EC's regional offices are listed on the following website: [http://www.ec.gc.ca/commentreg\\_e.html](http://www.ec.gc.ca/commentreg_e.html)
- DFO's contacts are listed by region on the following website: <http://www.dfo-mpo.gc.ca>

## REVIEW PROCESS

1. MOE advises appropriate MNR District Office, upon receipt of an application to apply *Bti* in Sensitive areas. MOE is responsible for providing MNR with information on the Sensitive area to be treated (name and location), and proposed *Bti* treatment schedule.

**Note:** In order to facilitate information exchange and the decision-making process for WNV larviciding, OMNR Districts are encouraged to provide public health units and MOE Regional Pesticide Officers with their maps. Provincial digital data may be available via a shared folder, at: \\mnrpbapc0888\WNV\_Maps. These maps show health unit boundaries, MNR district boundaries, Crown land, Provincial Parks, federal lands and evaluated wetlands. These are intended as a starting point for designated district or parks staff who will be dealing with health units. Districts may want to add other or better coverage as required e.g., Species at Risk, unevaluated wetlands, local coverage of wetlands.

2. MNR District staff accesses the Natural Heritage Information Centre's (NHIC) Natural Areas Database to determine if any endangered, threatened or otherwise "sensitive" species are known to be present in the Sensitive area. Two species lists have been developed: one by MNR's Species at Risk Section; and the other by NHIC. These lists will be updated on a regular basis as the evaluation and listing/regulation of species at risk at both provincial and national/federal levels is an ongoing process. MNR District staff should contact the Species at Risk Section of Ontario Parks and NHIC to ensure that the District has the most current versions of the lists.
3. MNR District staff forwards this information, in confidence, to the inter-agency committee and arranges a meeting or conference call to review the information. If a species of concern is found within the Sensitive area, Ontario Parks' Species at Risk Section, and the Natural Heritage Information Centre can provide advice on potential impacts/referrals to other experts. A site visit may help facilitate the review process.
4. MOE, with input from MNR, provides a written summary to all participants of the decisions made.

**Appendix 11**  
**Summary Report Templates**

## West Nile Virus Summary Report Template Treatments to Catch Basins With Methoprene

The following summary report example is based upon just two rounds of treatments to catch basins in three different sites issued under one approved permit. Please use this template to provide the information requested below and fill out all fields of this report.

**Permit Number:** 3567-62QJG1 (include on all pages of this document)

**Date:** November 30, 200X

### 1.0 Contact Information

**Name:** Fred J. Wright  
**Tel. No.:** 905-123-4567  
**Fax No:** 905-899-1547  
**Email:** fred.wright@home.ca

### 1.1 Exterminator Information

**Name:** Fred J. Wright  
**Licence Number:** 80-01-4568

## 2.0 Pesticide Information and Treatment Summary for All Rounds - Permit No. 3567-62QJG1

Pesticide Product Name	PCP No.	Amount Allowed under Permit	Total Amount Used for all Rounds	Total No. of Catch Basins Allowed to be Treated per Round Under Permit	Maximum Number of Individual Catch Basins Treated for all Rounds	Rate of Application	No. of Rounds
Altosid Pellets	21809	4.48 kg	4.20 kg <sup>(1)</sup>	3200	3023	0.7 g /cb	2
Altosid Briquets	27694	50	50	50	50	1 briquet/cb	1

<sup>(1)</sup> Total amount used for all rounds is calculated as follows:

Total catch basins treated in round 1 (3023) x 0.7 = 2116.1 g /1000 = 2.12 kg

Total catch basins treated in round 2 (2973) x 0.7 = 2081.1 g /1000 = 2.08 kg

2.12 + 2.08 = 4.2 kg

## 3.0 Catch Basins Treated

**Round #1 July 1<sup>st</sup> – 21<sup>st</sup>**

**Permit No. 3567-62QJG1**

Community/ Town/ Area Identified by Permit	Catch Basins Treated
Oneville	1890
Twotown	463
Threeburg	670
<b>TOTALS</b>	<b>3023</b>

Community/ Town/ Area Identified by Permit	Catch Basins Treated
Oneville	1800
Twotown	463
Threeburg	710
TOTALS	2973

**5.0 Type of Public Notification Used (\* Include a copy with this report and if a written notice was used indicate how it was distributed)**

☒ Newspaper\*   ☐ Written Notice\*   ☐ Public Area Sign

A copy of the dated newspaper notice has been appended to this summary report

**6.0 Immediate Receiving Water**

*(To the best of your knowledge provide the name of the immediate receiving water(s) the treated catch basins outflow into).*

(Municipal example) Storm sewers outfall into Janice Creek, Hog Town Creek, Carey Creek, Byers Creek, Martin Creek and Lashbrook Creek.

(Private Example ) To the best of my knowledge the treated catch basins are connected to the municipal storm sewer system.

or

To the best of my knowledge the catch basins drain into Brown Creek.

**7.0 Incidents Reported to Spills Action Centre (SAC)**

There were \_\_\_ incidents during the larvicide applications that required SAC to be notified. *Provide specific details of any incidents.*

**8.0 Universal Transverse Mercator (UTM) projection or Map locations**

*(Submit UTM co-ordinates or marked Maps with the location of the treatment areas and sensitive areas)*

## West Nile Virus Summary Report Treatments to Surface Water With Bti

The following summary report example is based upon one round of treatment to surface waters in three different sites using three different larvicide products issued under one approved permit. Please use this template to provide the information requested below and fill out all fields of this report.

**Permit Number:** 3589-62IPZ2 *(include on all pages of this document)*

**Date:** November 30, 200X

### 1.1 Exterminator Information

**Name:** Fred J. Wright  
**Licence Number:** 80-01-4568

### 2.0 Pesticide Information and Treatment Summary for all Rounds Permit No. 3589-62IPZ2

Pesticide Product Name	PCP No.	Amount Allowed under Permit	Amount & Rate Used for all Rounds	Total Area (ha) Allowed under Permit	Total Area (ha) Treated	*Maximum number of treatments
Vectobac 200G	18158	200 kg	180 kg 10 kg/ha	20	18	1
Aquabac 200G	26863	200 kg	0	20	0	0
Aquabac xt	26860	1.8 L	1.8 L	3	3	1

\*Maximum number of treatments is the greatest number of treatments applied to any individual location.

### 3.0 Treatment locations [a separate chart must be provided for each round]

Round #1 July 1<sup>st</sup> – 7<sup>th</sup>

Permit No. 3589-62IPZ2

Name and PCP No. of Product Used	Site Identified on Permit	Total Area Treated (ha)	Total Amount of Product Applied	Rate Applied
Vectobac 200G 18158	Oneville	15.5	155 kg	10 (kg/ha)
	Twotown	2	14 kg	7 (kg/ha)
	Threeburg	0.5	4 kg	8 (kg/ha)
Totals		18	173 kg	
Aquabac 200G 26863	Oneville	0	0	-
	Twotown	0	0	-
	Threeburg	0	0	-
Totals		0	0	
Aquabac xt 26860	Oneville	3	1.8 L	600 ml/ha
	Twotown	0	0	-
	Threeburg	0	0	-
Totals		3	1.8 L	

#### 4.0 Pre and Post Larvicide Monitoring Information

***Retain Larvae monitoring forms for two years. Complete the Summary Table***

##### **Pre-Larviciding Sampling Summary for Sensitive Areas/Ditches, Permanent or Temporary Pools and Storm Water Management Ponds (SWMP)**

Site Location Address or UTM	Type of Larviciding Program	Date of Monitoring	Pond Rating	Organic Level
115 Rock Rd	Sensitive area - ESA	July 6th	Moderate	Low
12 Steam St	Permanent Pool	July 6th	Moderate	Moderate
258 Oak Crt.	SWMP	July 6th	High	High

##### **Post-Larviciding Sampling Summary for Sensitive Areas**

Site Location Address or UTM	Type of Larviciding Program	Date of Monitoring	Pond Rating	Organic Level
115 Rock Rd	Sensitive area -ESA	July 8th	Low	Low

#### 5.0 Type of Public Notification Used (*\* Include a copy with this report and (if a written notice was used indicate how it was distributed)*)

☐ Newspaper\* ☐ Written Notice\* ☒ Public Area Sign

A public area sign that complied with the Appendix 2 option 3 of the West Nile Virus Permit Applicant Guide was used for public notification.

#### 6.0 Incidents Reported to Spills Action Centre (SAC)

There were \_\_\_ incidents during the larvicide applications that required SAC to be notified.  
(*Provide specific details of any incidents*)

#### 7.0 Universal Transverse Mercator (UTM) projection or Map locations

(*Submit UTM co-ordinates or marked Maps with the location of the treatment areas and sensitive areas*)
